### Computational Complexity

February 15, 2010

**You are expected to solve all the problems. Due on Mon, March 22<sup>nd</sup>. Collaboration is allowed; please mention your collaborators.**

1. Show that  $\Sigma_k = \text{NP}^{\text{CIRCUIT-SAT}_{k-1}}$ .

We define  $L \in \Sigma_k$  if and only if there is a deterministic polynomial time verifier  $V$  such that

$$x \in L \iff \exists y_1 \forall y_2 \cdots Q_k y_k \quad V(x, y_1, \dots, y_k) = 1$$

where length of  $y_1, y_2, \dots, y_k$  is bounded by a polynomial in  $|x|$ .

2.
  - Show that  $\text{P}^{\text{PSPACE}} = \text{NP}^{\text{PSPACE}} = \text{PSPACE}$ .
  - Show that if  $\text{PH} = \text{PSPACE}$ , then  $\text{PH}$  collapses to some finite level.
  - Can  $\text{PH}$  have a complete problem (complete under polynomial time reductions) ?
3. **(DP-completeness)** This problem studies the class  $\text{DP}$  (D stands for difference). A language  $L \in \text{DP}$  if and only if there are languages  $B \in \text{NP}$  and  $C \in \text{coNP}$  so that  $L = B \cap C$ .
  - The problem  $\text{SAT-UNSAT}$  is defined as follows: Given pair of Boolean formulae  $(\phi, \psi)$ , decide if  $\phi$  is satisfiable and  $\psi$  is unsatisfiable. Show that this problem is  $\text{DP}$ -complete (under polynomial time reductions).

- A graph  $G$  is in HC-CRITICAL if  $G$  is not Hamiltonian but adding any edge to  $G$  will make it Hamiltonian. Show that HC-CRITICAL is in DP.
4.
    - Show that  $\text{NP}^{\text{BPP}} \subseteq \text{BPP}^{\text{NP}}$  (*Hint : First show that a language in  $\text{NP}^{\text{BPP}}$  is accepted by a polytime NTM that makes a single query to a BPP oracle and that too at the end.*)
    - Show that if  $\text{NP} \subseteq \text{BPP}$ , then PH collapses to BPP.
  5. (**NEXP-completeness**) Define  $\text{NEXP} = \cup_{k=1,2,\dots} \text{NTIME}(2^{n^k})$ .  
 Show that the following problem is NEXP-complete : Given  $\langle M, x, n \rangle$ , consisting of description of a NTM  $M$ , input  $x$  and an integer  $n$  in binary, decide if  $M$  has an accepting computation on  $x$  in  $n$  steps.
  6. A circuit  $C$  is called an *implicit representation* of another circuit  $C^*$  if  $C$  takes as input a binary integer  $i$  such that  $n + 1 \leq i \leq N$ , and outputs a triple  $(\text{TYPE}, j, k)$  where
    - Input to  $C^*$  is an  $n$ -bit string  $x_1x_2 \dots x_n$ .
    - $\text{TYPE} \in \{\text{AND}, \text{OR}, \text{NOT}\}$  indicates the type of  $i^{\text{th}}$  gate in circuit  $C^*$ .
    - $1 \leq j, k \leq N$ .
    - The input of the  $i^{\text{th}}$  gate in  $C^*$  is the output of the  $j^{\text{th}}$  and  $k^{\text{th}}$  gates of  $C^*$  (if  $\text{TYPE} = \text{NOT}$ , then  $k$  is ignored. If  $1 \leq j, k \leq n$ , then the  $j^{\text{th}}$  or  $k^{\text{th}}$  gate is taken to be an input bit  $x_i$ ).
    - The  $N^{\text{th}}$  gate in  $C^*$  is its output gate.

Note that we could have  $N = 2^n$ , the circuit  $C$  could be of size  $\text{poly}(\log N) = \text{poly}(n)$  and still implicitly represent a circuit  $C^*$  of size  $N$  (in short, a circuit can implicitly represent another circuit of size exponential in its own size).

Let IMPLICIT CIRCUIT-SAT be the following problem : Given a circuit  $C$  that is an implicit representation of circuit  $C^*$ , decide if  $C^*$  is satisfiable. Show that this problem is NEXP-complete (*Hint : Use the regular structure of the circuit produced in Cook-Levin reduction*).

7.
  - Show that  $\text{NP}^{\text{NP} \cap \text{coNP}} = \text{NP}$ .
  - Generalize this to  $\text{NP}^{\Sigma_k \cap \Pi_k} = \Sigma_k$ .

8. The problem Graph Consistency (GC) asks, for two given sets  $A$  and  $B$  of graphs, whether there exists a graph  $G$  such that every graph  $g \in A$  is isomorphic to a (not necessarily induced) subgraph of  $G$  but each graph  $h \in B$  is not isomorphic to any subgraph of  $G$ . Show that GC is in  $\Sigma_2$ .
9. Show that if  $\Sigma_k = \Pi_k$  for some  $k$ , then  $\text{PH} = \Sigma_k$ .
