Coin-weightings and different directions of lines

Zoltan Furedi
Renyi Institute, Budapest and UIUC, Urbana-Champaign, IL, USA

Starting with a version of coin-weighting problems proposed by ApSimon (1984) we discuss directions of lines among lattice points. Consider a set $V$ of $k$ vectors on the plane with nonnegative integer coordinates. Let $S(V)$ be the set of the $2^k - 1$ non-empty subset sums. We are looking for the smallest $N = N(k)$ such that $V$ is a subset of $\{1, 2, 3, ..., N\} \times \{1, 2, ..., N\}$ and the slopes of the members of $S$ are all distinct.
